

Titles:

- LLMs are cool
 - analogy w/ online systems
 - geocoding via Maps
 - analogy w/ commercial software
 - Stata (mostly good)
 - MATLAB (pretty good)
 - SAS (not possible)
 - others

Here: Stata → containers → Docker Hub

There Open weight models on Hugging Face

- LLMs are data: training data

- Most social scientists do not
train de-novo foundation models

- Analogy: Clemons raw data (P) (L)
transcribed data (L)

- LLMs:

- Dell's American history (P) (L)

(P) - raw corpus

- foundation model (L)

- They trained LLMs on
(P) personal data (confidential)

- cannot ^{public} ~~interact~~ because
data are confidential,
but see LEND, statistical
agencies in general

- LLMs are used to generate data
 - generated data should be preserved and shared

Analogy

- ~ Geocoded data (output from geocoder)
- Data obtained via APIs
 - ~ public APIs
 - commercial APIs (Bureau Dykes, Refinitiv, Bloomberg Terminal)

- LLN generated data is a random draw

→ frequently ignored in social sciences and computer science

make here
importance of
statistical
foundations of
data science

Examples:- probabilistic linkages
(intergenerational
mobility
literature)

- imputations for missing
data (surveys, admin
data)

Here : no good analogy!

Suggestion : Draw from multiple
models

- Provide all draws

- Use all draws in
analysis

→ multi inference
